

The learning curve

Blackboards and smart classes, research grants and scientific patents. There are different faces to education – some that exist within the walls of an institution, in schools and universities that strive to bring a different definition to the word education, reaching out to unexplored territories in arts, sciences, medicine or even law, others providing distance education to little known places on the map. It's a learning curve - whether it's an institution that specializes in scientific research, a mint-fresh new MBA school that has overtaken outdated B-schools or even traditional universities modernizing their policies. The success stories are there in programmes that try to make learning fun, bridging the gap between teachers and students, in coaching centres that produce IIT toppers or in a private university with best education practices. These are the people and the institutions that are crafting new success stories in education, whether it's through a policy formed in a boardroom, or a teacher in a tiny school in a remote village.
