

It is rightly stated that the objectives of higher education for any society, particularly one striving to grow into a knowledge society, are not only to address the knowledge needs of the present time, but also to project the knowledge needs of the future. If we look at the recent trends, Education in general, has become learner-centric with continuous technology intervention in the class room teaching methodology as well as distance studies which is getting more effective through innovative strategic planning, digital libraries and Internet connectivity.

IN PURSUIT OF EXCELLENCE FOR QUALITY EDUCATION

Education is not only about intelligence rather it is more about learning to live like a human being, to instil and imbibe values that teaches to respect one and all, and not only to be able to differentiate between right and wrong but also to dissuade people from taking the wrong as a way, to understand ourselves and to be able empathize with others, to understand, protect and nurture nature for a good future and healthy planet for next generation. The excellence in education would not happen only by teaching and encouraging them for getting good marks in exams or by getting selected for a top job but by training them to become a good human being and responsible citizen to lead the nation for a bright future.

The modern temples of learning are the one who will have to initiate and imbibe these values and till that happen the pursuit would continue.

An **IMPACT** Presentation
