

Accuracy Comes to War on Cancer

No anaesthesia, no pain, no physical trauma, no side-effects. The patient lies comfortably for 30 to 90 minutes and goes back home. Doesn't quite sound like the dreaded C-word? But that's precisely what a breakthrough technology promises to cancer patients. The CyberKnife—the world's first and only robotic radiosurgery system designed to treat tumours anywhere in the body with sub-mil-

limetre accuracy—has just been launched at the Apollo Speciality Cancer Hospital, Chennai, the only one in the country. It uses robotics to deliver an extremely precise dose of radiation to targets, avoiding healthy tissue and adjusting for patient and tumour movement during treatment. Patients who had only high-risk alternatives can now opt for a safe and non-invasive procedure.

Timely Help

The biggest threats to women's health are mostly preventable, if you know how. Metropolis Health Services, a chain of ISO 9002 certified diagnostic centres, is offering check-up packages to women to celebrate International Women's Day. Discounted up to 45 per cent, the package will screen the liver, kidneys, heart, thyroid gland and put you through a slew of tests—complete blood count, pap smear, blood sugar, lipid profile, weight. The price is about Rs 1,000. "Women today work full-time, run a home and bring up a family and it's easy for them to let their health suffer," says executive director Ameera Patel, explaining the rationale. The offer is valid till April 8. Time to take charge of your health.

7 THINGS THAT MAKE YOU EAT MORE

Even when you are not hungry

AN EYEFUL

When you see food you like, the mesolimbic region in your brain lights up and sparks hunger.

SWEET SIN

Sweet, starchy foods boost serotonin, a mood elevating hormone. It's a craving.

TIP OVER

Drinking can impair the judgment of hunger and make you overeat.

FINE MESS
Refined carbs cause hunger pangs within a few hours of eating because blood sugar levels crash.

NOT COOL
Metabolism drops when it's time to eat; eating warms you up. Heat is a satiety signal. The colder the temperature, the more people tend to eat.

CLOCK WORK

We're conditioned. The vagus nerve stimulates the stomach into action at regular mealtimes.

SMELL TEST

One of the key cues for the body to induce insulin secretion. And that in turn makes us think we're hungry.
