in the number of candidates resulted in such a severe strain on the administration that the exam will now be a computer-based test like GRE or GMAT.

But while their popularity remains unchanged, there is a variation in the profile of an average MBA student at premium B-schools from previous years. In the past, most students had little or no work experience. However, in the class of 2010 at IIM-A, 67 per cent students had prior work experience. At ISB, the average work experience for the class of 2009 is five years and these students come not just from the predictable IT or finance sectors but also have a background in the armed forces or the healthcare industry. "You will find that the average years' of experience is increasing in most cam-

puses. This is a healthy sign and shows the maturing of students wanting a management degree without the imposition of any curbs, societal or otherwise," says Dr Devi Singh, director, IIM-Lucknow.

B-schools seem to realise the importance of diversity in a business classroom and are consciously encouraging students from all streams to apply. So while the IIMs continue to be dominated by an overwhelming number of engineers (nearly 90 per cent), several schools are challenging this monopoly. Almost 50 per cent of the 2010 class at LIBA comes from a non-engineering background. This elective mix includes students from the media, hospitality and science.
