

UTTARAKHAND IS THE FASTEST MOVER (2003-09)

With improved ratings in fiscal management and other parameters, the newly carved-out state is way ahead in primary health compared to its parent Uttar Pradesh.

of the pyramid. Of the 110 crore populace, 62 crore live in states that are at the bottom of the pile. Six of the most populous states are languishing at the bottom 10 of the rankings. Bihar, Jharkhand and Uttar Pradesh ranged at the bottom three are home to a third of the country's population. Yes, rankings are about comparative performances but what is shocking is that despite special intervention schemes the worst three languish. Bihar is at the bottom of the table in six of eight categories, and even in agriculture where it has natural advantages it is in the bottom five. What is tragic is that there is no shake-up even amongst the "disadvantaged". Bihar and Jharkhand have been static for five years and Orissa and Uttar Pradesh have been swapping places at 17 and 18. Legacy is admittedly a disadvantage the Bimaru states suffer from but there seem to be no effort to seek intervention of available Central schemes. Analysis of data shows that the states are the worst performers in spending allocations available for rural doles, primary education and rural connectivity.

India lives in the states and just as every inch of India is ruled by the states, every decimal of GDP growth comes from the states. Unless the Centre and these states engineer a common programme to lift these economies, the shadow of poverty will continue to haunt India and thwart its trust with destiny.

PRIMARY HEALTH

Good health in a state is captured by the infant mortality rate, the percentage of births assisted by trained personnel as that also impacts maternal health, and registered doctors on a per capita basis. Access to water is critical for good hygiene which has a direct impact on health outcomes, and this is captured by the proportion of households with access to tap water. Removal of biases against women as well as the girl child is critical and this is captured by the sex-ratio (females per male) as well as the girl-boy infant mortality ratio. Many health problems are due to poor practices, and greater government expenditure also reflects the importance paid to health issues. Therefore per capita expenditure on health and family welfare by the state government is also included.
