

India emerging as global leader in telecommunication

Widening the spectrum of communication

History of Indian Telecommunications started in 1851 when the first operational land lines were laid by the government near Calcutta (seat of British power). Telephone services were introduced in India in 1881. Indian telecom sector since then has come a long way in achieving its dream of providing affordable and effective communication facilities to its citizens as envisaged in New Telecom Policy (NTP) 1999.

With over 375 million telephone subscribers today, India now boasts of having the second largest telecom network in the world after China. The country is adding some 8.5 million to 10 million new mobile subscribers to the network every month to also emerge as one of the fastest growing telecom markets in the world. India has emerged as a major base for the telecom industry worldwide and it is the endeavor of the Government to facilitate further growth of this vital industry as it is not just the growth of the sector but it has a 'multiplier effect' on the economy as a whole.

All major telecom handsets manufacturers - including Nokia, Samsung, Motorola and LG - have their presence in India, so do leading global service companies and infrastructure majors, such as Vodafone, Singapore Telecom, AT&T, Ericsson, Alcatel and Siemens.

GSM Vs. CDMA:

The mobile industry in India is divided between the two technologies-GSM and CDMA. While the initial tilt was towards the GSM with players like Bharti, Aircel, Vodafone, Spice, BPL and BSNL preferring it, the TATAs and the Reliance entered the market putting their bets on CDMA.

Whether GSM is better or CDMA is more superior is certainly a debatable issue. As per the present scenario, it is probably an understatement to say that cell phones have become the single greatest tool in business as well as personal communication. In a scenario like this where customer is the king, future certainly belongs to service providers showing flexibility as well as technological excellence. With 3G coming in, another revolutionary step is from desktop videoconferencing to mobile videoconferencing enabling to communicate wherever you are.

Punj Lloyd

Punj Lloyd is the pioneers in India's broadband industry with the first commissioned fibre optic network spread across Delhi and the NCR. They have developed and deployed turnkey telecom solutions of data, voice, and video networks, including the design and implementation of high-quality hybrid networks comprising optical fibre, co-axial cable and microwave equipment and also undertake the design, engineering and construction of copper and optical fibre networks and testing of GSM and CDMA equipment.
