results are not documented and measured. Without a long-term, self-sustaining solution that reduces poverty, we are likely to create higher levels of inequality. If neglected, these concerns will undermine the very social legitimacy of the corporation.

No institution is an island. Private sector institutions are an integral part of society and cannot prosper without recognising the social context within which they operate. Inequities are a major scar on societies. A solution to persistent and growing social inequities is the defining issue in this election in the US. In India, it is a call for inclusive growth. The demand on the private sector, the institutional embodiment of the principles of capitalism, to recognise and respond to these concerns is urgent. India represents a unique opportunity for developing the practice of capitalism for the 21st century. It has a vibrant private sector and a participatory democracy. It also has inequalities, not just in incomes but also in terms of opportunities. If the country can find a way to make capitalism work by addressing problems of poverty, illiteracy and subsistence agriculture while creating new opportunities for the poor and vibrant businesses at the same time, the consequences are tremendous. There is no better place to develop the "next practice of capitalism" than India.

I developed the concept of India@75 not just to provide a vision for the country but also to encourage experimentation and for the development of a new model of social and economic structure. For example, developing India's educational infrastructure can turn the country's massive illiteracy into a knowledge hub of the world. This would mean that India will have to educate 200 million college graduates, and 500 million professionally-trained technicians. If we want to become the knowledge hub, then the quality of skill development and college education must be world-class. It must also be done in a short period of 15 years. This calls for a fundamentally new approach to the delivery of education—not just improving the public sector or creating quality controls on the rapid growth of private sector in education. We need to combine unprecedented scale, speed, world class quality, universal access and affordability simultaneously.

The challenge of building a knowledge
