

Principle of BIO-SCULPTING™ using SPECTRAL FIR

Influenced by a ultrasound field and SPECTRAL FIR energy, water molecule in the human body starts wagging and shaking with high speed.

As a result, heat is produced by the friction between water molecules. Passing through body impedance, the SPECTRAL FIR energy produces heat and higher temperature occurs at the depth of several millimeters under dermis with no harm to body tissue.

The SPECTRAL FIR energy of Blizz Bio-Sculptor can be transmitted to the depth of 7.5-21.5mm, which causes the fat to melt, in the whole procedure the topical skin temperature is normal, whereas the inside temperature is in the range of 45 to 55 Blizz Bio-Sculptor lipolysis treatment principle (Fat Reduction, Body Contouring)

The newly deposited connective tissue matrix can be used to strengthen the natural fibrous layer between the dermis and subcutaneous tissues, Adipose tissue is highly sensitive to blood flow. The thermally-induced hyperemia caused by the SPECTRAL FIR energy which enhances blood circulation and the release of free fatty acids (FFA) to the local adipose tissue bed. And it increases lipolysis stimulation in catecholamines available in the local area, thus promoting release of FFA into the bloodstream. Because of the thermal trauma to the fat cells, triglycerides are released from the fat cells. These triglycerides are
