

Gift Of Homoeopathy

Use of Biochemics / Bio-combinations

For treatment of most of the common ailments

With a view to popularise Homoeopathy beside other non-allopathic systems of medicine, the Government of India created a separate department with an independent Secretary in the Ministry of Health, known as Department of AYUSH. The department is entrusted with the responsibility of developing and propagating, among others, Homoeopathy.

Homoeopathy is a holistic system of treatment and offers preventive as well as curative interventions. Homoeopathy is known to treat and cure many chronic diseases. Homoeopathy essentially is a natural therapy that stimulates the body's immune system to fight illness and allows the symptoms of the disease to dissipate. Almost 90% of Homoeopathic medicines are derived from plants, minerals and organic matter.

Till recently Homoeopathic medicines could be sold only through Homoeopathic Pharmacies. Such Pharmacies number only 8000 in the country – compared to 16 lac Allopathic Pharmacies in the country.

The Government of India, after considerable deliberation, has now amended the Laws / Rules, permitting the well-known Biochemic / Bio-combination medicines of Homoeopathy to be freely available through the allopathic chemists also. In the case of Bio-combination, a common man can easily identify the particular Bio-combination to treat his particular symptom of disease. Bio-combinations are easily affordable and reported to be effective.

The principle of Homoeopathy was discovered by Dr. Samuel Hahnemann (1755-1843) who himself was an allopathic doctor. Homoeopathic medicines are extremely gentle rather than violent - respecting and preserving the intricate mechanism of the biological systems. Homoeopathy is virtually non-toxic, without side effects. There is no addiction or buildup of tolerance or resistance, even with long term use.

It was Dr. Schussler (German Homoeopath), who discovered that the normal activity of the human cell depends on a standard amount of inorganic salts. That was in 1873. Dr. Schussler wrote that the inorganic substances found in the blood and tissues are sufficient to cure all the diseases that can be cured. According to him, any variation in the normal amount of inorganic, nutritive salts, especially a deficiency of these salts was the cause of disease. His therapy consisted of compensating the deficiency of inorganic salts through their medicinal counterpart. He grouped the BIOCHEMIC salts into 12 basic tissue salts. These are:
